
ICIC2026 Acceptance Notification for paper 57

ICIC2026 <icic2026@easychair.org>

Sat, Sep 5, 2026 at 9:17 AM

To: Muhammad Zainal Muttaqin <mz.muttaqin1@gmail.com>

Dear Muhammad Zainal Muttaqin,

We are pleased to inform you that your paper:

Paper ID: 57

Title: Benchmarking Multi-View Tree-Level Oil Palm Bunch Counting Under a Fixed Detector
submitted to the International Conference on Informatics and Computing (ICIC–APTİKOM 2026) has been
ACCEPTED for oral presentation.

We cordially invite you to present your paper at ICIC–APTİKOM 2026.

To ensure that your paper is included in the conference proceedings, you are required to prepare and submit
the camera-ready version in accordance with the instructions provided on the ICIC–APTİKOM 2026 website.
Papers that do not comply with the required format or submission guidelines may not be included in the
proceedings.

Please prepare your camera-ready paper using the required IEEE Proceeding format (ID for PDFExpress:
71916X).

Detailed instructions regarding paper formatting, similarity requirements, and other publication requirements
are available on the conference website.

At least one author of each accepted paper must complete the registration and present the paper during the
conference. Please complete the following requirements:

Author registration: <https://forms.gle/zDsyWbWge8zBQRTY9>Camera-ready submission: <https://forms.gle/1fXpSsDGeif7kbzs7>Pre-recorded presentation video, if required: <https://forms.gle/7T32wzhGVhEL1dfX6>Invoice Request: <https://forms.gle/8fD52dyyYybJCAHb8>

The important deadlines are as follows:

Early-bird registration deadline: 12 September 2026

Camera-ready submission deadline: 25 September 2026

Presentation video submission deadline: 25 September 2026

Regular Registration Due: 25 September 2026

Please note that failure to complete the registration by the specified deadline will be considered a withdrawal
of the paper from ICIC–APTİKOM 2026.

The conference will be held in HYBRID mode on 8-9 October 2026 at Hotel Sahid Raya, Yogyakarta. Authors
may attend the conference, subject to the participation arrangements established by the organizing
committee.

All conference information, submission guidelines, registration fees, and related materials are available at
icic-aptikom.org

Should you have any questions regarding registration or the preparation of your camera-ready paper, please
contact Shinta at +62-8128839520.

We look forward to welcoming you to ICIC–APTİKOM 2026.

Warmest regards,

SUBMISSION: 57

TITLE: Benchmarking Multi-View Tree-Level Oil Palm Bunch Counting Under a Fixed Detector

SUBMISSION: 57

TITLE: Benchmarking Multi-View Tree-Level Oil Palm Bunch Counting Under a Fixed Detector

----- Overall evaluation -----

SCORE: 2 (accept)

----- TEXT:

Overall, great. Only a few revisions can be added to strengthen your research paper:

1) CONCLUSION: Include further implications for the field. Discuss benefits or shortcomings of your work and suggest future areas for research.

Thank you

----- REVIEW 2 -----

SUBMISSION: 57

TITLE: Benchmarking Multi-View Tree-Level Oil Palm Bunch Counting Under a Fixed Detector

----- Overall evaluation -----

SCORE: -1 (weak reject)

----- TEXT:

The paper has a worthwhile contribution because it addresses an underexplored problem in oil-palm computer vision: tree-level multi-view fruit-bunch counting rather than merely image-level detection.

The controlled comparison between ground-truth and fixed-detector conditions is particularly valuable and produces a clear practical conclusion.

However, the current manuscript does not yet provide sufficient evidence to support some of its broader conclusions. The use of a single detector, limited test set, absence of statistical significance analysis, and limited error decomposition are the main weaknesses.

I would recommend acceptance after minor revision, provided that the authors strengthen the statistical analysis, clarify the scope of their conclusions, and provide a more rigorous decomposition of detector and counting errors.

----- REVIEW 3 -----

SUBMISSION: 57

TITLE: Benchmarking Multi-View Tree-Level Oil Palm Bunch Counting Under a Fixed Detector

----- Overall evaluation -----

SCORE: -1 (weak reject)

----- TEXT:

The authors should prioritize the following revisions:

1. Add statistical uncertainty/significance analysis for the reported model differences.
2. Clarify the scope of the detector-related conclusion, because only one detector checkpoint is evaluated.
3. Provide more detailed error decomposition for missed detections, false positives, and maturity-class confusion.

4. Add additional counting metrics, especially per-class MAE/RMSE and total bunch-count error.
5. Strengthen validation using repeated splits, cross-validation, or an independent plantation if available.
6. Expand the feature-definition table to improve reproducibility.
7. Discuss the poor Random Forest performance more thoroughly.
8. Moderate broad generalizations about detector quality versus counter quality.
9. Clearly distinguish detector performance limitations from multi-view association/aggregation limitations.
10. Carefully proofread the manuscript for formatting, equations, tables, and citation consistency.

----- REVIEW 4 -----

SUBMISSION: 57

TITLE: Benchmarking Multi-View Tree-Level Oil Palm Bunch Counting Under a Fixed Detector

----- Overall evaluation -----

SCORE: 1 (weak accept)

----- TEXT:

The paper features a clear problem statement and maintains a logically coherent, contradiction-free trajectory by investigating the gap between multi-view detection and tree-level aggregation in oil palm bunch counting. The SawitMVC dataset (953 trees, 3,992 images) provides sufficient data with well-defined splits, and the literature review adequately connects multi-crop agricultural vision methods to current oil palm gaps. The methodology is sound; decoupling ground-truth from fixed-detector inputs offers empirical novelty by definitively demonstrating that detector quality—rather than regression counter design—is the primary deployment bottleneck.

Both discussion and conclusion are focused, honest about limitations, and well-supported.

For revisions, the authors should fix several noticeable typesetting and column-alignment errors in Tables III and V, briefly evaluate an additional detector architecture to strengthen the generalizability of the findings, and clarify how robust the vertical spatial features are to real-world camera pitch variations.
